Cloud Services. How will it benefit my organization? How do I get started?

Navigating through the world of cloud services can be a daunting task. Keeping an eye on security, cost-effectiveness, usability and the ability to manage it all can be overwhelming for IT staff.

Planet's Cloud Services Assessment is the first step in evaluating and creating a cloud service strategy. This fixed-fee service offering is designed

to provide CIO's and their staff with assistance in making practical decisions on providing IT infrastructure services in an outsourced or hosted model. This new offering assists organizations in addressing areas such as:

- **How to begin evaluating hosting options**
- **Whether an application should be hosted internally or externally**
- **The pro's and con's to a hosted application**
- **How to assess the impact on your current infrastructure**
- **Insight in evaluating the right model for success**

Planet's two-day Cloud Assessment includes:

- A clear and detailed discussion of your requirements, both technical and as a business
- Advice and guidance on the technologies and services which are currently available
- Architectural guidance and input in to how the use of 'Cloud' based services can be integrated into your current systems processes and practices
- Formulation of next steps and strategic plan for adoption

Planet Technologies has consulted with more than 300 of the world's leading hosters on service positioning, delivery and deployment. This experience is invaluable for our Public Sector clientele as they require thorough and independent support on the capabilities of hosting applications and architectures.

"We are responding to our customer's desire to deliver secure and accessible IT services to their users while dealing with an influx of support options that need to be seriously evaluated. The landscape is changing fast; organizations are asking for an independent analysis of a hosted approach. They now have a trusted and independent partner with deep experience and understanding in the software as a service model to help jumpstart their analysis."

– Scott Tucker, President,
